

GRA-CFP2600

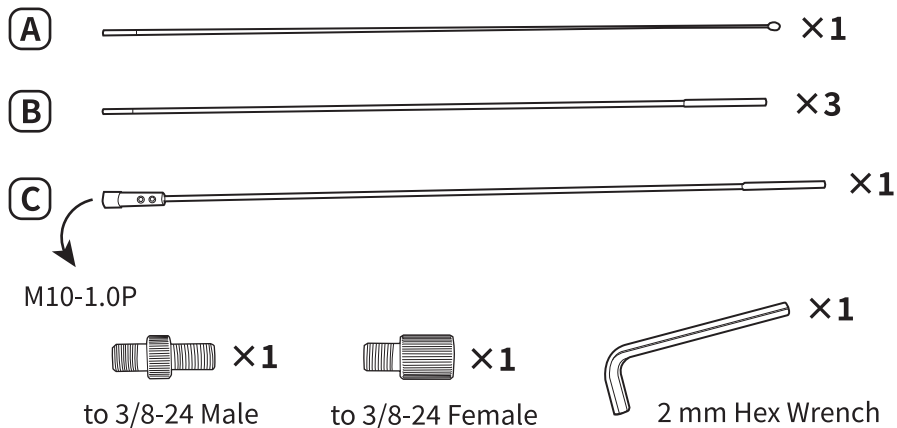

5-Section Plug-in Carbon Fiber Whip
Structure, Operation,
and Band Configuration Guide

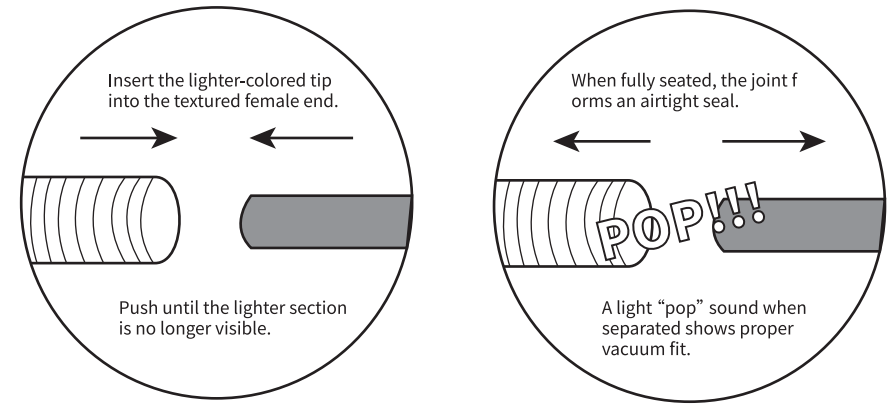

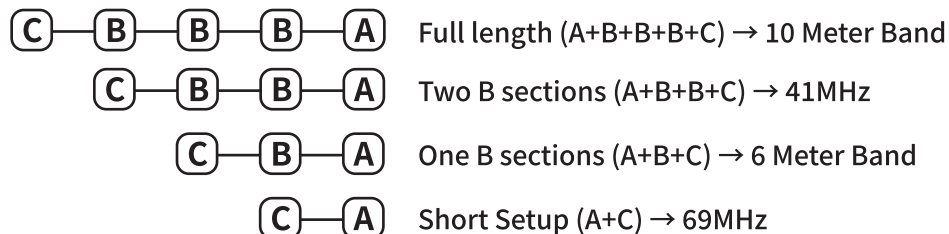

Before Assembly

- Ensure all sections are clean and free of dust before assembly.
- Align each joint carefully and insert straight — do not twist or force.
- Apply gentle, even pressure until the section is fully seated.
- Avoid over-tightening or impact while assembling or disassembling.
- Handle with care to maintain the vacuum-fit precision between sections.
- Except for the two hex screws on the stainless-steel base, all assembly and connection should be done by hand only. Do not use tools, pliers, or wrenches, as this may damage the carbon fiber body.

This whip is designed for precise plug-in assembly. Follow the illustrated steps below to ensure optimal performance and longevity.

Band Configuration Guide

1. Insert the lighter-colored tip into the textured female end.
2. Push until the lighter section is no longer visible.
3. Fully seated joint ensures stable conductivity.
4. The three middle sections are identical and interchangeable.
